

Your radon questions, answered.

What is radon?	Radon is a naturally occurring radioactive gas, which is found - in some quantity - in all buildings. Exposure to high levels over a long period of time can lead to health issues.
Why test schools?	Simply to check that no children or staff are being exposed to high levels of radon gas. A similar survey carried out in 1989 found no problems at that time.
How does the test work?	A number of coaster sized plastic detectors were placed in ground floor rooms and basements for three months, before the data was analysed.
What happens if an issue is found?	Any problems found will necessitate some small scale remedial work.
Why is it happening now?	DEFA has a legal obligation to take a series of actions to limit people's exposure to radon due to recently updated health and safety legislation.
Are children at more risk than adults?	No. The general pattern is broadly similar to that in adults.
What is the harm or risk from radon?	There is compelling evidence that long-term exposure to radon can increase the risk of lung cancer.
How serious is a reading of 300 – 950 at my child's school?	Not at all serious. Radon levels vary considerably between regions and even neighbourhoods, from tens of Bq/m ³ to many thousand Bq/m ³ . In parts of England there are tens of thousand Bq/m ³ but there is no direct link between these levels and lung cancer. This is only a potential risk over many years of exposure and is exacerbated greatly in smokers (acting in synergy with the radon exposure).

Visit <https://www.ukradon.org/faq/#> for further information and frequently asked questions regarding Radon.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Other comments - if applicable

One or more of the monitors were not returned from this measurement. Radon levels can vary substantially even within the same building so, for re-assurance, you should organise further tests in the locations from which the monitors were not returned.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Other comments - if applicable

One or more of the monitors were not returned from this measurement. Radon levels can vary substantially even within the same building so, for re-assurance, you should organise further tests in the locations from which the monitors were not returned.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Other comments - if applicable

One or more of the monitors were not returned from this measurement. Radon levels can vary substantially even within the same building so, for re-assurance, you should organise further tests in the locations from which the monitors were not returned.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Other comments - if applicable

One or more of the monitors were not returned from this measurement. Radon levels can vary substantially even within the same building so, for re-assurance, you should organise further tests in the locations from which the monitors were not returned.

Regulations

The Ionising Radiations Regulations 2017 (IRR17) apply where there is work in an atmosphere where the radon level is greater than 300 Bq m⁻³ (becquerels per cubic metre of air) as an annual average. Where the IRR17 applies, employers are required to take action to control the resulting exposures. Radon levels in buildings typically follow a clear seasonal pattern (higher in winter, lower in summer), so seasonal correction factors are used to estimate the annual average concentration that indicates whether the Regulations apply.

Advice

Seasonal correction factors are calculated only for the United Kingdom (UK) climate and cannot be applied to measurements in any other country. In addition, we cannot interpret these results with respect to regulations or action levels outside the UK. Please contact the local competent authority for details on the applicable standards.

The above advice applies to these results only.

If you have a Radiation Protection Advisor please ensure you pass these results on to them.

Other comments - if applicable

Please note there is increased uncertainty associated with these results due to the short measurement duration. We would advise carrying out a 3 month validated measurement to confirm these results.
